

Health Content Check

How to set it up in ChatGPT. Step by step, about 5 minutes. You do not need any technical knowledge.

Read this first, it saves you ten minutes

ChatGPT has a Skills feature, but as of September 2026 OpenAI lists it for Business, Enterprise, Healthcare and Edu accounts only, and availability keeps changing.

So the main instructions below use a **Project** instead. Projects work on every plan and do the same job here.

If your account does have Skills, there is a shorter route on the last page.

One real limitation, worth knowing before you start

ChatGPT's Python sandbox has no internet access, so the bundled reference-checking script cannot run there. Claude can verify that a citation is real. ChatGPT has to search for it instead, which is weaker.

If your pages cite references, check them yourself: search each DOI or PMID and confirm the title, authors and year match what the page claims.

Before you start, you need three things

1. A ChatGPT account, at chatgpt.com.
2. The file **health-content-check.zip**, saved to your computer. For this route you **do** need to unzip it.
3. A computer. This part cannot be done on a phone.

Part 1. Unzip the folder

- 1 Find **health-content-check.zip** in your Downloads folder.
- 2 Unzip it.
Windows: right click, then Extract All. Mac: double click it.
- 3 You now have a folder holding **SKILL.md**, a **references** folder and a **scripts** folder. Leave the window open, you need it shortly.

Part 2. Make the project

- 4 Go to **chatgpt.com** and sign in.
- 5 In the sidebar on the left, click **Projects**, then **New project**.
If the sidebar is hidden, click the icon in the top left to open it.

- 6 Name it **Health Content Check** and create it.
- 7 Open the project and find **Instructions**.
It may be called Add instructions, or sit behind a settings or pencil icon.
- 8 Open **SKILL.md** from the unzipped folder in any text editor.
Windows: right click, Open with, Notepad. Mac: right click, Open With, TextEdit. It is a plain text file, nothing will break.
- 9 Select all of it, copy it, paste it into **Instructions** and save.
- 10 Back in the project, upload the three files from the **references** folder: **criteria-gate.md**, **improvement-playbook.md** and **production-process.md**.
Look for Add files, or drag them onto the project. You do not need the scripts folder for this route.

Part 3. Use it

- 11 Start a new chat **inside the project**. This matters. A chat outside the project will not know any of this.
- 12 Paste your page, or attach it, then type:
Check this patient information page. Follow the project instructions and use the reference files.
- 13 Read what comes back, and fix the Required items first.

One difference from Claude, worth knowing

The bundled **verify_refs.py** script checks that a reference is real. It runs reliably in Claude. In ChatGPT, ask instead:

For every reference on this page, search for the DOI or PMID and tell me whether the title, authors and year match what is claimed.

Everything else works the same.

If something goes wrong

If this happens	Do this
ChatGPT ignores the instructions	You are probably chatting outside the project. Open the project first, then start the chat from inside it.
It will not accept the .md files	Rename them so they end in .txt and upload again. The contents are identical.

Answers drift over a long chat

Start a fresh chat inside the project. The instructions reload every time.

It invents a number or a reference

Say: **Remove every figure that has no source. Do not replace it with an estimate.** This is the one failure that matters, so check the numbers yourself.

Shorter route, only if your account has Skills

1. Click **Plugins** in the sidebar, then open the **Skills** tab.
 2. Click **Create**, then **Upload from your computer** and choose the zip, not the unzipped folder.
 3. Wait for the automatic scan to finish, then turn the skill on.
 4. Note that skills do not carry across devices. If you use ChatGPT on a laptop and a phone, you have to add it in each place.
- If there is no Skills tab, your plan does not have the feature. Use the Project route above, it is not a lesser version.

One thing to be clear about

This is a **self-check**. It does not certify anything, and it gives you no badge, tick or logo to put on your website.

Quality marks are awarded by schemes that assess how you produce content over time, not by anything that looks at a single page. If you want one, apply to the scheme.

What you can honestly say is that your content is written to the NHS standard for creating health content. That is true and it is worth saying.

Menus change. If what you see does not match this guide, the current version is at github.com/alistairphillips1/health-content-check
