

Health Content Check

How to set it up in Gemini. Step by step, about 5 minutes. You do not need any technical knowledge.

Before you start, you need three things

1. A Google account. Gems are free on every Gemini plan, including the free tier.
2. The file **health-content-check.zip**, saved to your computer. For this route you **do** need to unzip it.
3. A computer. Gems can only be built in the Gemini web app, not the mobile app. Once built, the Gem appears on your phone automatically.

One real limitation, worth knowing before you start

The bundled reference-checking script does not run in Gemini. Claude can verify that a citation is real. Gemini has to search for it instead, which is weaker.

If your pages cite references, check them yourself: search each DOI or PMID and confirm the title, authors and year match what the page claims.

Part 1. Unzip the folder

- 1 Find **health-content-check.zip** in your Downloads folder.
- 2 Unzip it.
Windows: right click, then Extract All. Mac: double click it.
- 3 You now have a folder holding **SKILL.md** and a **references** folder. Leave the window open, you need it shortly.

Part 2. Build the Gem

- 4 Go to **gemini.google.com** and sign in.
- 5 In the sidebar on the left, click **Gems**, then **New Gem**.
It may say Explore Gems first. Open that, then New Gem.
- 6 Name it **Health Content Check**.
- 7 Open **SKILL.md** from the unzipped folder in any text editor.
Windows: right click, Open with, Notepad. Mac: right click, Open With, TextEdit. It is a plain text file, nothing will break.

- 8 Select all of it, copy it and paste it into the **Instructions** box.
Do not click the magic wand to rewrite the instructions. It will shorten them and drop the rules that matter.
- 9 Under **Knowledge**, click **Add files**, then **Upload files**. Add the three files from the **references** folder.
criteria-gate.md, improvement-playbook.md and production-process.md. If it refuses a .md file, rename it to end in .txt and try again.
- 10 Click **Save**.
Previewing on the right does not save it. You have to click Save.

Part 3. Use it

- 11 Open the Gem from the sidebar. Every chat you start from there carries the instructions.
- 12 Paste your page, or attach it, then type:
Check this patient information page. Follow your instructions and use the knowledge files.
- 13 Read what comes back, and fix the Required items first.

If something goes wrong

If this happens	Do this
The Gem ignores the knowledge files	Say so directly: Use the criteria gate file and the improvement playbook. Knowledge files are consulted less reliably than instructions.
It will not accept the .md files	Rename them so they end in .txt and upload again. The contents are identical.
Your changes vanished	You previewed without saving. Open the Gem, make the change again, click Save.
It invents a number or a reference	Say: Remove every figure that has no source. Do not replace it with an estimate. This is the one failure that matters, so check numbers yourself.

One thing to be clear about

This is a **self-check**. It does not certify anything, and it gives you no badge, tick or logo to put on your website.

Quality marks are awarded by schemes that assess how you produce content over time, not by anything that looks at a single page. If you want one, apply to the scheme.

What you can honestly say is that your content is written to the NHS standard for creating health content. That is true and it is worth saying.

Menus change. If what you see does not match this guide, the current version is at github.com/alistairphillips1/health-content-check
